

Week 1

Day & Date	Discussion Topics / Activity	Details of work allotted till next / Corrections Suggested
Day 1 (May 25) Mon	First day of internship, We started with basic introduction of other class members. We started with Basic HTML. I learned setup the standard page using html, head, body tags. I also practiced text formatting like bolding, underline, strike etc. Also learnt marquee, imag tags.	Practice creating a simple webpage using basic text formatting tags covered today
Day 2 Tue, 26 May	Today I learned more tags. I added meta tags for page setup & created a simple data table with rows & cols. I also got how to add actual image, vid & aud in a webpage. I tested scrolling imgs through marquee	Build a webpage containing a table with headers, data rows and add some video, clips in page
Day 3 Wed 27 May	Today was all about lists & tables. I learned how to make ordered, unordered & description list and also nested lists. Also tried colspan & rowspan, spacing etc.	Create a page that uses nested lists and build a receipt using table.

Day 4 Thu May 28	Today, I learned forms. I learned how to create different text input fields like username, email, password, etc. And also radio buttons, checkboxes, dropdown list & how to add a file. Worked with labels & input fields & created a working form. And also practiced form using table.	Create an academic form for registration and add all fields that are required.
Day 5 Fri 29 May	Today I worked on a mini project combining what I have learned so far. I designed a fee receipt for school using HTML tables & attributes such as colspan & rowspan.	Create a fee receipt of any receipt you have and recreate it using table in HTML.
Day 6 Sat 30 May	Today, I was introduced to CSS. I explored different ways to style HTML, including inline CSS, internal CSS & external page linking. I practiced using different selectors like ID, class & name. & also learned the priority.	Review the concepts of CSS. Apply inline, internal & external CSS to previously created HTML pages.

Today I focused on page layouts using div tags & CSS. I practiced nesting multiple divs & styling them with the specific heights, widths & background. I explored advanced CSS selectors including pseudo class like :hover & pseudo element like ::before.

Create provided layouts using CSS.

Today I worked on structuring a basic website header using html & css. I created a main container and applied display flex and add another two divs. and applied margins & paddings.

Create a basic navbar using html & css like divs , margins & padding.

Today was all about modern CSS layouts. I then deepdived into flex & CSS grid to align multiple boxes perfectly. I created several webpage layouts.

Create the given CSS layouts,

Day 10
Thurs
Jun 4

Today, I learned how to make webpages responsive. I've started using flex-wrap so elements of div don't get squished. Then I learned about CSS media queries (@media) to change layouts for different screens. I created some responsive web pages.

Create a responsive webpage that fits for every screen.

Day 11
Fri
Jun 5

Today I combined everything that I learned to create a multi-pages website using HTML & CSS. I've created a website "Webcraft Academy" and added 5 pages, linked them, and added some CSS to it.

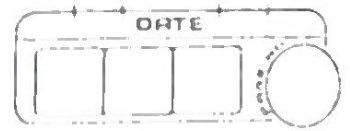

Create a full 5 pages website

Day 12
Sat
Jun 6

Today we were still working on the main website project. Sir came around to check our project & looked up through our code and suggested some changes and then I applied the changes to my website.

Implement the recommended changes to make finalise project.

Week 3

Sive

Day 13
Mon
Jun 8

Today was the presentation of website. Sir is si was sat there we were going to present our projects. After all of the project presentation, Sir showed us how you can make your website more better using Figma ai make tool.

Transform your website through Figma make into a stunning one.

Day 14
Tue
Jun 9

Today was all about Github. Sir taught us how to create a github account and setup our profiles. We went over essential git commands like git clone, git push, git commit. Finally I created my github account.

Create github account and push your project on it.

Day 15
Wed
Jun 10

Today, I finally pushed my project to github. Sir again taught us how we can use Figma to make better websites. with prompting. And asked for whose projects were remained to show.

Practice pushing your project from your local to github repo.

te

ne

se

Day 16 Thu Jun 11	Today started Javascript! I wrote my first JS script directly inside HTML file. I learned how to set up variables using var, let & const, performed basic math operations add, sub, div & mul and displayed the results using different methods like document.write(), console.log() & alerts.	Practice writing JavaScript codes to understand how it works.
Day 17 Fri Jun 12	Today I explored string manipulation in Javascript. I learned how to set up various string built-in methods to modify the text in the code. I practiced finding a strings length, converting text to uppercase & lowercase & splitting sentences into arrays. I also tested strings concat and swapping specific words using replace.	Practice string built-in functions and write a JS program using them.
Day 18 Sat Jun 13	Today we learned how to dynamically generate html code using Javascript. I practiced different html tags like headings & bold texts used in javascript to display on the webpage.	Take a e-commerce card div and recreate it using javascript. and also a contact form.

Week 4

Day 19 Mon Jun 15	Today I took dynamically generating HTML with Javascript to the next level. Instead of just basic tags, I used JS string concatenation to build complex layouts like product cards with images & texts. I even generated a complete working contact form with validations entirely through JS.	Create your website form with validations using JS	
Day 20 Tue Jun 16	Today was all about making webpage interactive with Javascript event listeners! I learned three ways to trigger actions: inline attributes, DOM and addEventListener method. I tested out various mouse events, including clicks, double-clicks, hover effects and also track the x & y mouse coordinates.	Explore additional Javascript events such as keyboard, focus events. Use them in a webpage.	
Day 21 Wed Jun 17	Today I continued with Javascript events by building real-time form validations.	Build a cooking calculator using html, css & js.	

Instead of using those basic popup alerts, I wrote JS to display alert messages in a red box under input areas.

Build a complete registration form using validations

Day 22
18 Jun
Thu

Today we took a break from coding and had a theory session introducing jQuery. Ma'am explained how it's fast, lightweight JS library. The main takeaway was learning its 'write less, do more', which allows us to write complex JS functions & DOM manipulations in few lines.

Review basic jQuery syntax and read some jQuery functions

Day 23
Fri
19 Jun

Today we finally started coding jQuery. I linked jQuery the library with the link and tested out some basic visual effects. I wrote a quick script that makes paragraphs disappear whenever you click on them. Then I built image fader using buttons to fade in & out for 3 seconds.

Practice jQuery basic methods & `addClass()`, `removeClass()` to apply or remove CSS dynamically.

Day
Sat
20

Day 24
Sat
20 Jun

Today we practiced using jQuery's `addClass()` & `removeClass()` methods to dynamically change styles, div structure look completely different at a click of button. We also tried to convert our previously done JS code using jQuery.

Convert previous JS practicals using

Week 5

Day 25
Jun 22
Mon

Today, ma'am provided Bootstrap JS files to include in our practicals for quicker styling & components. After that we had a really interesting introduction to databases. We learned basic terminology and then started our very first practicals using XAMPP. to setup local server. We learned how to create database, tables & how to insert data, how to delete them.

Review provided Bootstrap.js files in your practicals. Use xampp to create two to three sample db's & insert min fifty records in them.

Day 26
Jun 23
Tue

Day
Ju
Th

Da
J
F

Day 27
Jun 25
Thu

Today we created a database for students and created student table. Added column after the table was created using ALTER query. Then performed some "select" operations, before that inserted 50 records in the table. Then applied some conditions in SELECT queries. Practiced MIN, MAX, SUM, AVG & LIKE in the SELECT queries to display output.

Create 5 sample tables, insert Fifty records in each

Day 28
Jun 26
Fri

Today, we learned about constraints in ^{DBMS} SQL like primary, foreign, super keys, unique, check, not null. And used them in tables to set some validations

Use minimum ten constraints in table and check data inserts properly or not.

Day 29
Jun 27
Sat

Today, we tried advanced SQL queries. We created an advanced relational DB. for an insurance system with tables for customers, policies, claims, agents and payments.

We inserted some records in them. and practiced complex queries like RANK(), SUM(), OVER, CASE statements and GROUP BY WITH ROLLUP. Also used subqueries and LIMIT OFFSET.

Practice writing more complex SQL queries and use in student table. Install microsofts powerbi tool.

Week 6

Day 30
Jun 29
Mon

Today, we gone through data analytics. Today got some theory of data analytics like what is data analytics, analysis, types of data analytics. Then Business Intelligence, data analytics lifecycle, skills required. Difference between data analyst, scientist, engineer, business analyst, BI developer, ML engineer, DBA, data architect. Also gone through UI of powerbi

Take the overview of powerbi and some icons like graph, chart, etc.

Day 31
Jun 30
Tue

Day 32
Jul 1
Wed

Today, we had to install MySQL workbench, and ODBC driver & connectors to connect databases to the PowerBI tool and transform the data into visual format. I got had got some issues while installing workbench, I tried but couldn't resolve so ma'am helped me for installation. Then I connected database to powerBI

Complete the installation whose remained or got errors-
Also write some sql queries to sort data

Day 33
Jul 2
Thu

Today we learned about MySQL workbench. How to import SQL script file in it. Then we tried some queries like select and applied some conditions. Then we moved to PowerBI, ma'am explained UI of powerbi & learned how to connect MySQL database to powerbi. Then imported database then created a table, measure & also an unconditional column. Then ~~some~~ tried visualization of that measures like chart, pie chart, etc.

Try experimenting with visualization and try creating table, column & measure.

[illegible]

Week 7

Day 36

9 Jul

Thu

Today we learned about how we can use python for backend. We learned about postman. I created a database in XAMPP and then we used python to connect & access database using flask. Then get into some methods like GET, PUT, DELETE to insert, delete or update records in DB. Created an API key in python and used in postman to perform CRUD operations.

Practice with more databases and tables, try this using MySQL workbench also.

Day 37

10 Jul

Fri

Today we ~~got~~ learnt some theory of Node.js like what is if? etc. Today we installed node.js and learned about npm (node package manager) and modules, their types. Then we tried to import our modules from another file in current file.

Create more modules like for even odd, positive-negative and import them and use them.
